services lead

“bjss

**Today we will cover:**

- 1. Defining sustainable features from the start**
- 2. Sustainability UI checker**
- 3. How design can enable greener software**

# **1. Defining sustainable features from the start**

**Why think 'sustainability'  
from the start?**

**Why think about sustainability when you can just let the problems pile up for someone else to deal with later?**

# For sustainable digital transformation in Sweden – a Digital Strategy

The strategy outlines the focus of the Government's digital policy. The vision is for sustainable digital transformation in Sweden. The overall objective is for Sweden to become the world leader in harnessing the opportunities of digital transformation.

**Start**

**This is what happens when you don't  
think 'sustainability' from start...**

**Let's imagine that  
a cost-effective  
house was built.**

👎 Usable  
👎 Accessible  
👎 Sustainable

👍 Usable  
👎 Accessible  
👎 Sustainable

👍 Usable  
👍 Accessible  
👎 Sustainable

👍 Usable  
👍 Accessible  
👍 Sustainable

# So think from start...

**Creating products that are unusable, inaccessible and unsustainable is a cost-effective way to disappoint everyone.**

Cost effective

“Google new logo is only 305 bytes, compared to old logo at ~14,000 bytes

14,000 bytes

305 bytes

## 2. Sustainable UI checker

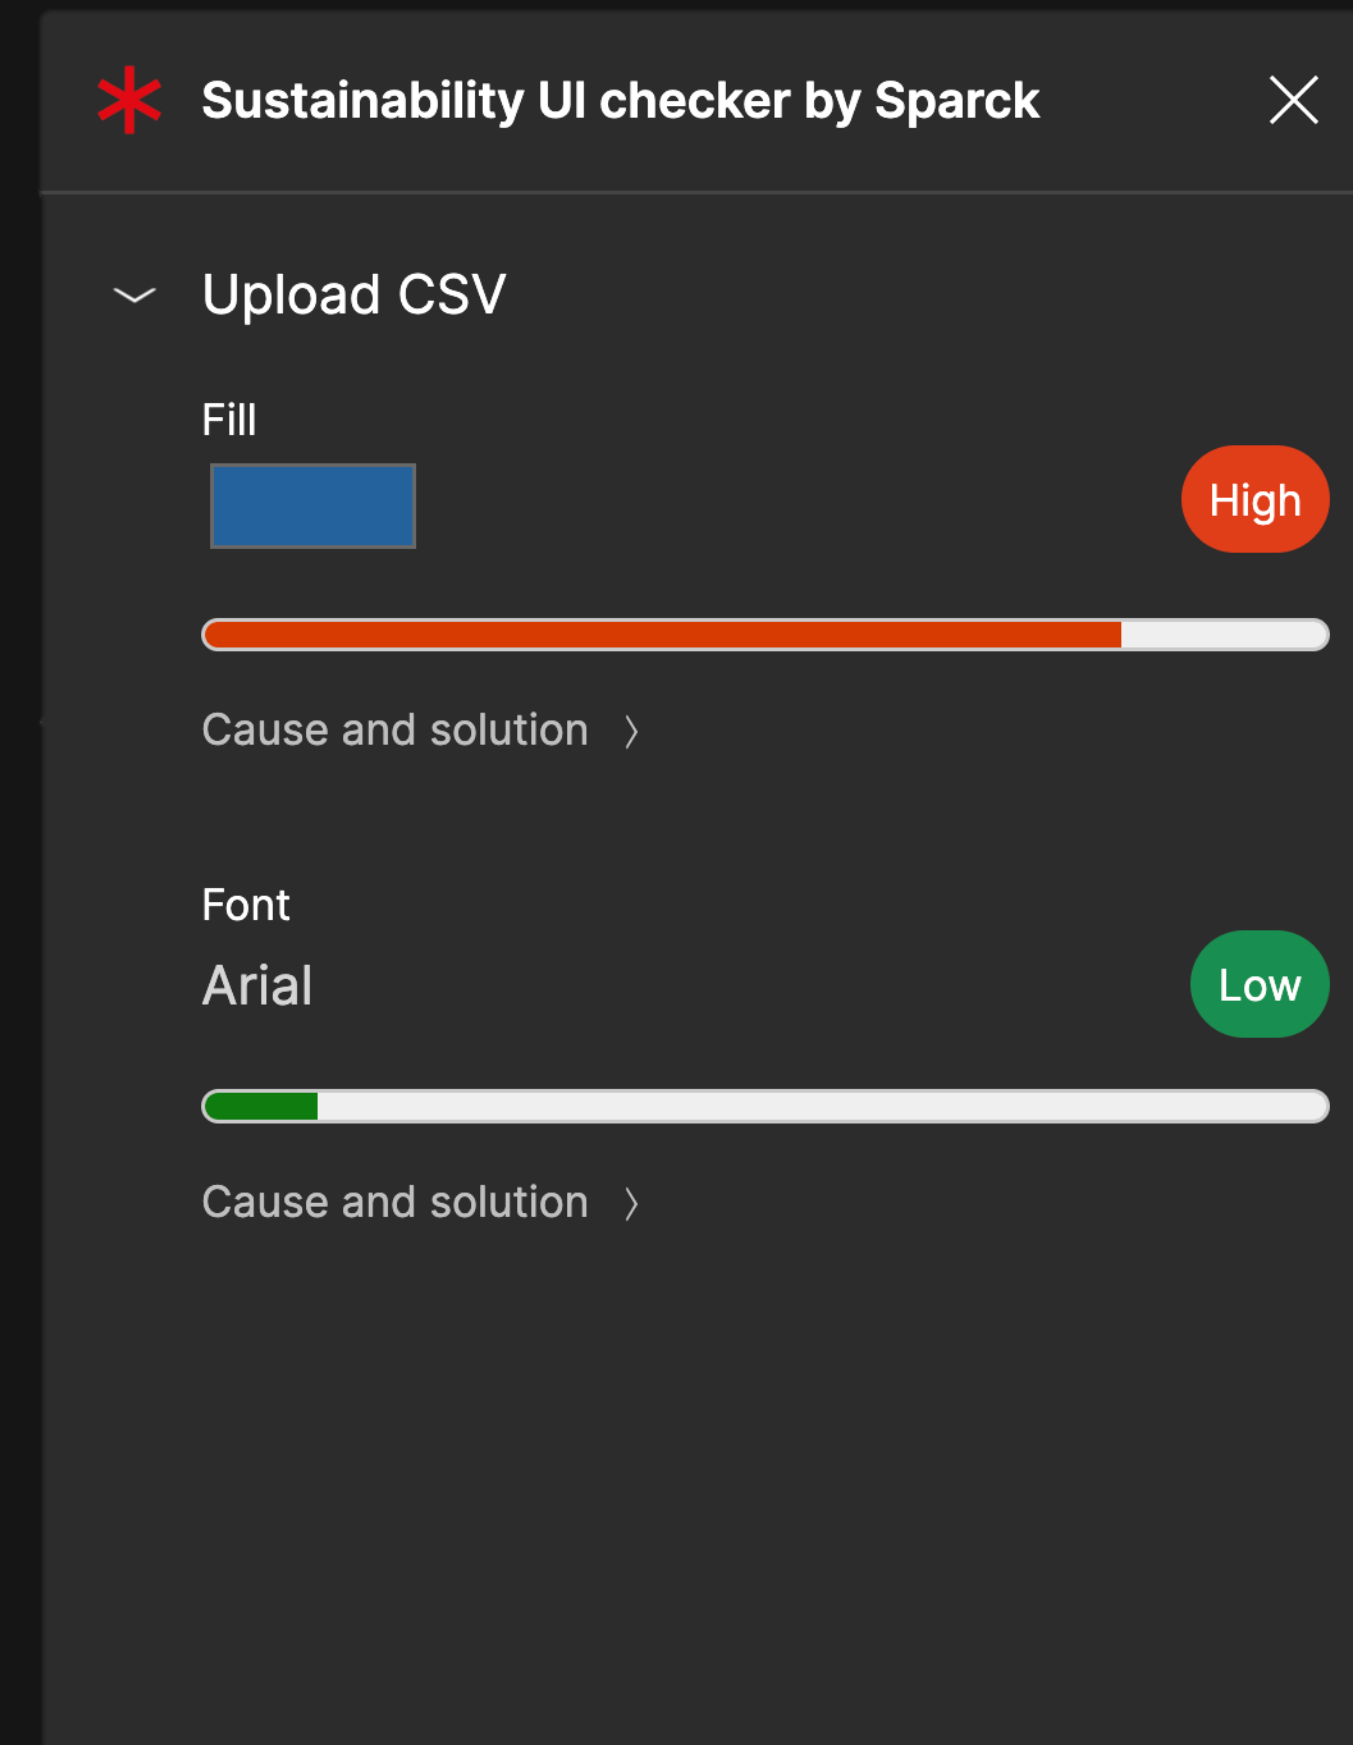

We developed a Figma plugin to help our designers and clients make sustainable UI choices. And we've made it publicly available.

Font

Colours

Effects

Images & videos

# Developed from desktop research

DOI: 10.1109/TMC.2011.167 • Corpus ID: 16318670

## Power Modeling and Optimization for OLED Displays

Published in Energies 12 May 2020 •  
Computer Science, Engineering

# Energy consumption guide

The plugin is based on a classification guide for UI choices

	Low	Moderate	High
Font	System fonts	Default/most used fonts	Custom fonts
Colours	Red / Orange	Yellow / Green	Blue / Purple
Effects	Simple effect (no gradient or blur)	Gradient, blurred shadows	Multiple effects
Media (image/video)	Smaller than proportion of dimensions, resolution and file size	Optimal proportion of dimensions, resolution and file size	Smaller than proportion of dimensions, resolution and file size / Video

**PLUGIN DEMO**

An example of a low-energy consumption colour pallete we developed for a client

# Transitioning to low energy mode

To help our client adopt a Low Energy mode ethos, we've started updating the palette to map colour tokens between normal and low energy mode using local variables in Figma.

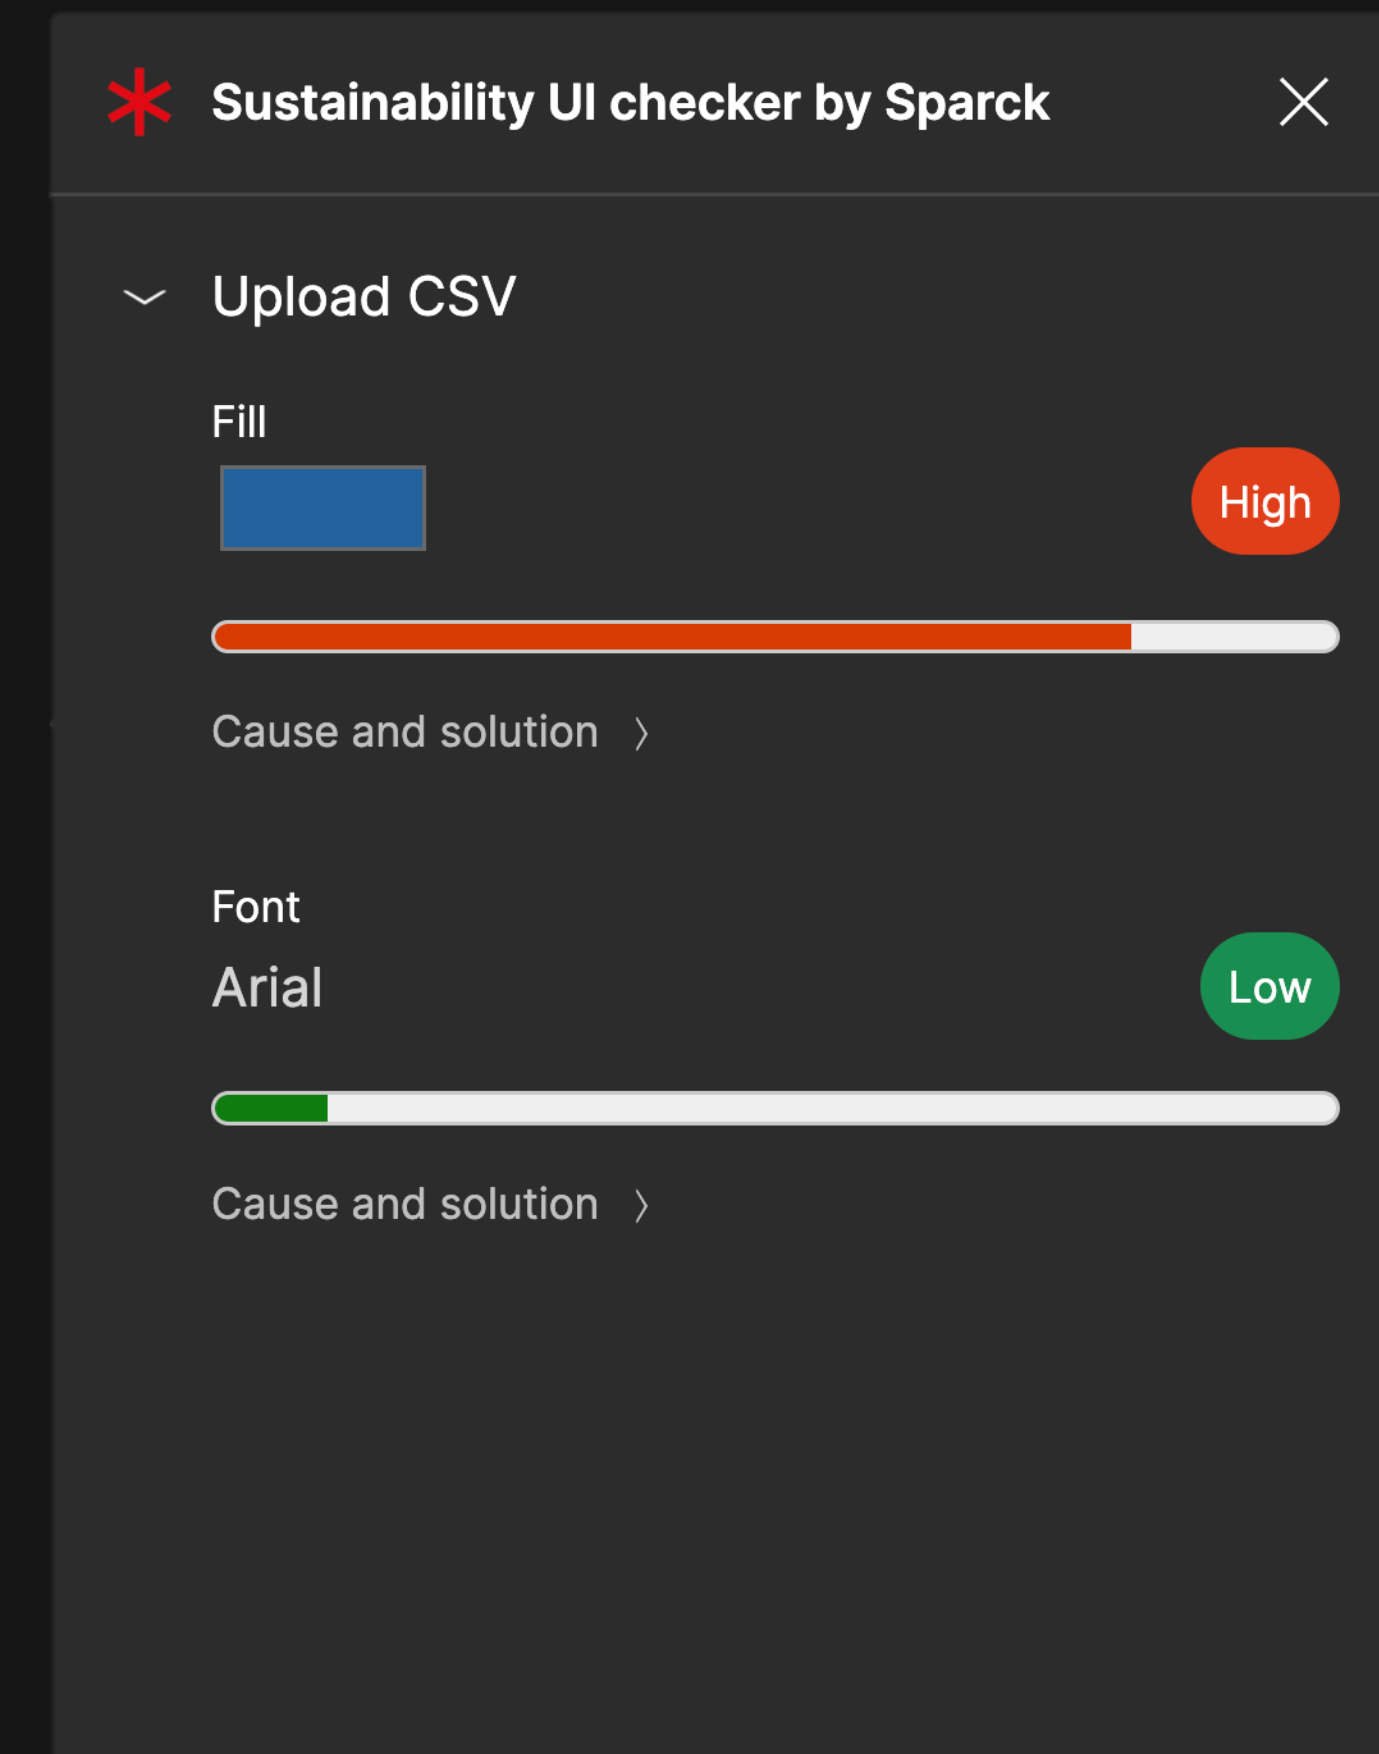

## 3 key takeaways

1. Embrace sustainability from the start, save money in the long run.
2. Sustainability improves usability and accessibility, not just the environment.
3. Small, continuous sustainable transitions can have a big impact on the environment and user experience.

# Download the plugin

And please, give us feedback!

### **3. The role of design in enabling greener software**

# We need to rethink common ‘must haves’

Designers play a key role in not unnecessarily adding to the carbon management burden in the first place.

## The trend towards...

### A. Immediacy

“The service must be real-time”

### B. Including ‘just in case’

“We must include this in case...”

### C. Richest customer experience

“The user must be highly engaged ...”

### D. Never deleting anything

“We must retain this feature as it was a priority need 5 years ago...”

Low-Carbon  
Solutions

# Introducing Greenflix

**Greenflix is the fictional sustainable streaming platform we envisaged to educate our people on sustainable software design and engineering**

# A. Rethinking the need for immediacy

## The impact of not acting

- Real time data feeds during peak hours are carbon intensive

Nov 30 @  
3:00pm

65.8%  
fossil fuels

- Data refreshes create significant emissions.

1 GB download /  
transfer

15 km

## The opportunity to be greener

- Carbon Intensity APIs provide a forecast for energy mix and can identify green windows

A screenshot of a web interface titled 'Calling the 24 Hour Future API'. The interface shows a GET request to the endpoint `/intensity/now24h/{postcode}` with a parameter `intensitynow24postcode`. Below the URL bar, there is a 'Parameters' section with a 'Cancel' button. The parameters are listed in a table:

Name	Description
<code>postcode</code> <span style="color: red;">* required</span> string (path)	W2
<code>originalfrom</code> string (query)	Date & time of time workload would have been scheduled to run eg 2023-03-12T20:00:00Z
<code>originalto</code> string (query)	Date & time of time workload would have finished eg 2023-03-12T20:30:00Z

At the bottom of the form, there is an 'Execute' button.

- Making workloads carbon aware (demand shifting) can result in 45-99% carbon reductions.
- Defining the criticality of features and user actions enables lower-carbon job scheduling

# A. Rethinking the need for immediacy

## Questions to ask

What's the impact of not having real-time or near real-time data?

How time-sensitive is a particular decision?

How can we better tie activation of features to user need?

## Applying to Greenflix

Daily content/user info refresh

**Use spare energy to download your movies**

When you want to download a video, place it in a queue and it will download at the optimum time with the lowest carbon intensity

Play challenge >

Carbon aware downloads

Load notification centre only on homepage (“what’s new?”)

# B. Rethinking the need for ‘just in case’

## The Impact of Not Acting

- 80% of features in the average software product are rarely or never used (Pendo Feature Adoption Report, 2019)

## The Opportunity to be Greener

- Design for known/likely use cases, engineers can build in flexibility and observability to respond to future scenarios.  
**Flexibility not Perfection.**
- Accurately define the when by, how often, how quickly etc. of current and predicted user needs
- We can modularise features and default to ‘switched off’

# B. Rethinking the need for ‘just in case’

## Questions to ask

Is there enough clarity around a future scenario to design for it?

Does a choice / trade off I’m making now create a constraint for the future?

How might current trends be affected by increasing climate consciousness?

## Applying to Greenflix

Wide-scale adoption of XR uncertain

**Sustainability and speed**

Optimising your experience is another way we reduce our carbon footprint. E.g. optimising the search function allows you to find your film quickly with less carbon

Play challenge >

Limits of desirable AI

Simple search functionality is ‘good enough’ for now & for most

# C. Rethinking the need for the richest CX

## The Impact of Not Acting

Globally, the average web page produces approximately **0.8 grams** CO2 equivalent per pageview. For a website with 10,000 monthly page views, that's **102 kg** CO2e per year.

## The Opportunity to be Greener

**Do Nation**  
0.29g CO2/page view

**C40 Cities**  
0.34g CO2/page view

**Riverford Organic**  
0.23g CO2/page view

Calculate

kg of carbon dioxide is equal to

**5.6**

kilometres of driving.

Calculate

kg of carbon dioxide is equal to

**709.8**

kilometres of driving.

Potential to reduce CO2 per page view by up to 72%

# C. Rethinking the need for the richest CX

## Questions to ask

Does the user need to interact with all page components on first view?

How much visual impact is necessary for this stage of the user journey?

How might I design for the most excluded? (A lighter experience will work for most)?

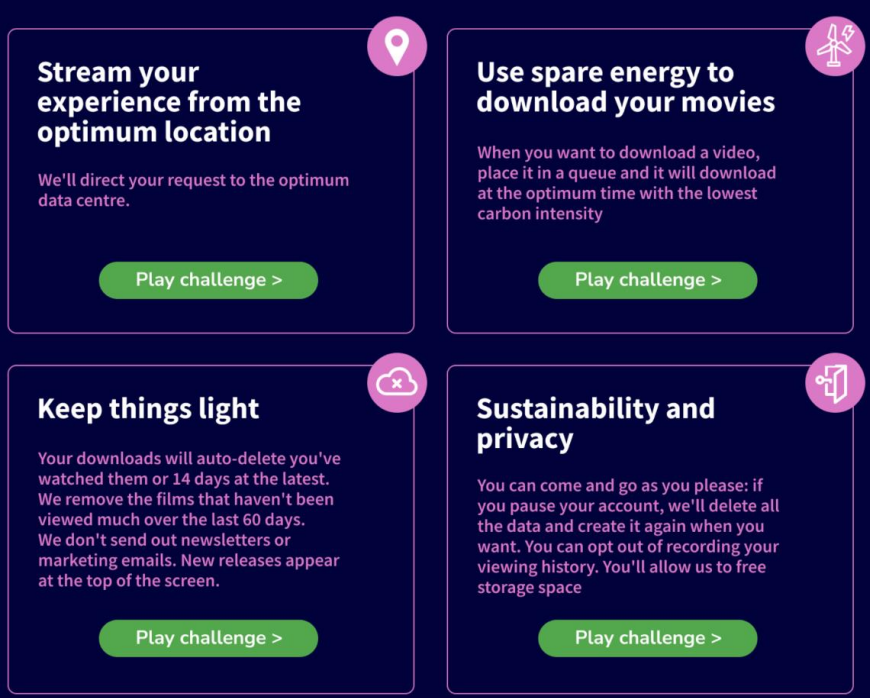

## Applying to Greenflix

User action portal – “what do you want to do?”

A richer UX may be justified to attract new customers

Minimal distractions, simple UX/UI. User chooses own journey

# D. Rethinking the need to retain everything

## The Impact of Not Acting

Veritas estimated that in 2020, 5.8 million tonnes of CO2 was pumped into the atmosphere as a result of storing unnecessary 'dark data' would require a forest 500 times the size of Manhattan to absorb.

If the work isn't done in considering data capture at the solution design – AI will make up the shortfall, at a heavy environmental cost

Co2 emissions from training a Large Language Model once

## The Opportunity to be Greener

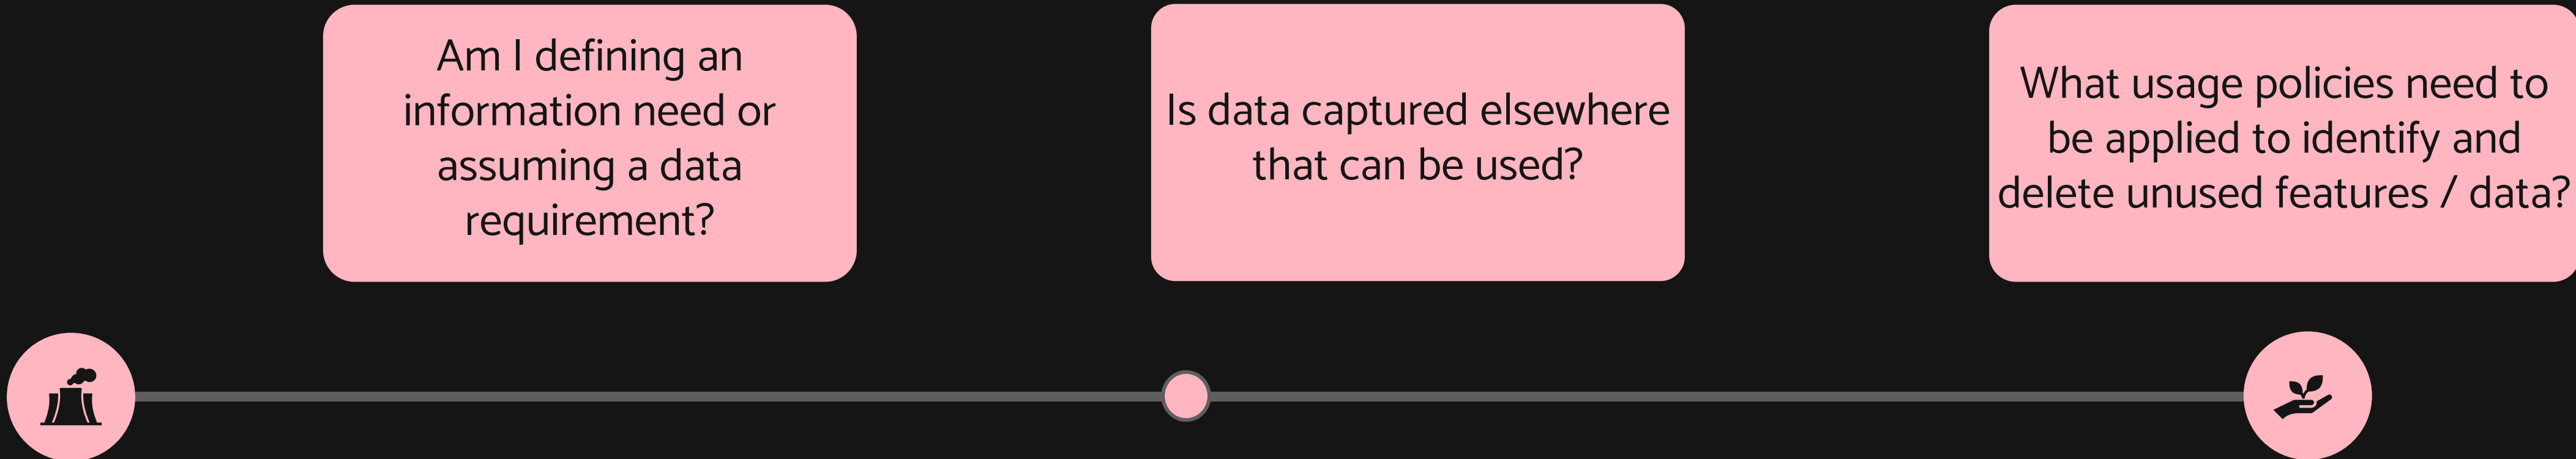

- Much of that 55% of dark data can be re-used. We can avoid duplicating assets that already exist.
- Multiple tools exist to support data retention monitoring and feature monitoring
- Engineers and designers need to work together to identify what can be removed

# D. Rethinking the need to retain everything

## Questions to ask

## Applying to Greenflix

Periodic request for viewing preferences – avoid AI

### Sustainability and privacy

You can come and go as you please: if you pause your account, we'll delete all the data and create it again when you want. You can opt out of recording your viewing history. You'll allow us to free storage space

Play challenge >

Minimal data set stored for paused accounts

### Keep things light

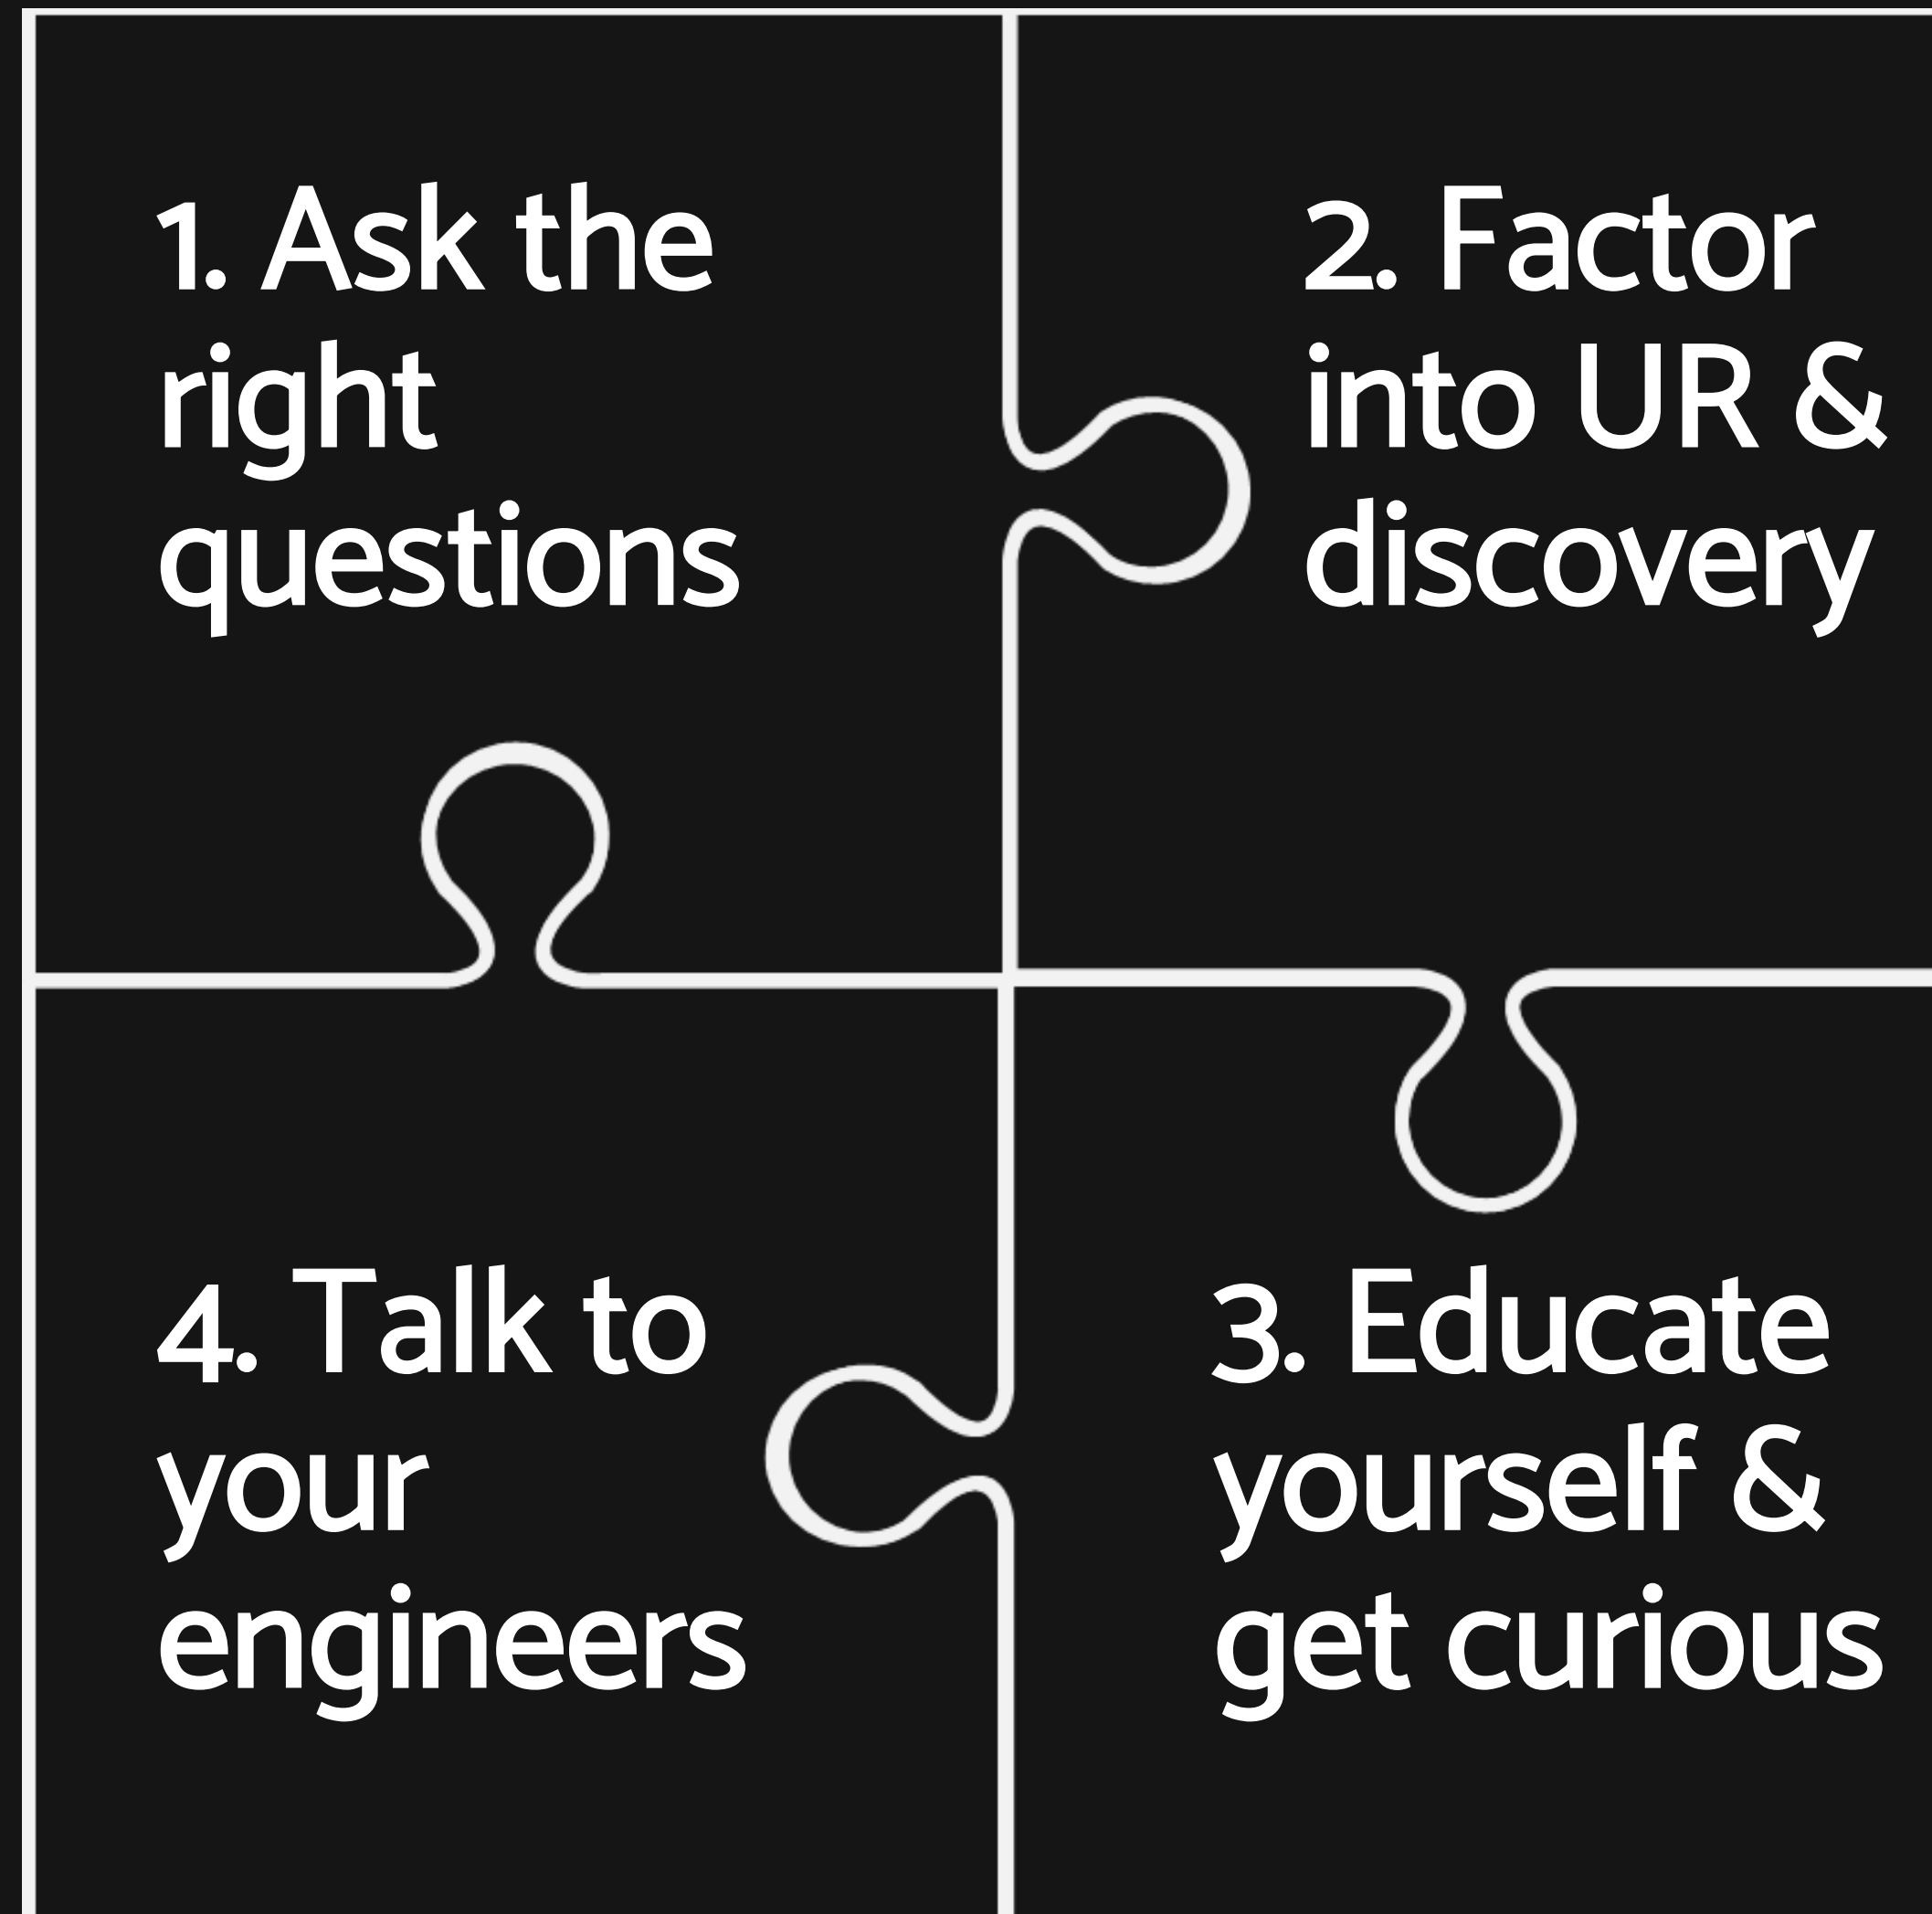

Your downloads will auto-delete you've watched them or 14 days at the latest. We remove the films that haven't been viewed much over the last 60 days. We don't send out newsletters or marketing emails. New releases appear at the top of the screen.

Play challenge >

Viewing history and downloads regularly purged

# Key takeaways – unlocking greener solutions

# Thank you – questions?

## Defining sustainable features and designing sustainable UI

1. Embrace sustainability from the start
2. Sustainability improves usability and accessibility, not just the environment
3. Small, continuous sustainable transitions make big impact

## Unlocking greener solutions

1. Ask the right questions
2. Factor into UR and discovery
3. Educate yourself and get curious
4. Talk to your engineers
